**Hefei (1), October 2019**

**Thanks to all my research workers and collaborators**

PhD, 1975-1979

**Double-pass SISAM spectrometer for the near infra-red (1–2  $\mu\text{m}$ )**

**$\text{HO}_2\cdot$  free radical**  
 **$A^2A' \rightarrow X^2A''$   $\lambda_0 = 1.43 \mu\text{m}$ ,**  
**resolution  $0.2 \text{ cm}^{-1}$**

**$\text{DO}_2\cdot$  free radical**  
 **$A^2A' \rightarrow X^2A''$**

**Geometry (two bond lengths, one bond angle) determined in both electronic states**

***Mol. Phys.*, (1979) 37, 379 & 403**

**PhD (1979) :  $O_2 a^1\Delta_g \rightarrow X^3\Sigma_g^-(0,0)$  band,  $\lambda_0 = 1.27 \mu m$**   
**Classic example of P, Q and R-branches,  $\Delta B \sim 0$  : resolution =  $0.2 \text{ cm}^{-1}$**

Figure 4.3 : High resolution spectrum of  
 $O_2 \ ^1\Delta_g(v=0) \rightarrow \ ^3\Sigma_g^-(v=0)$ .

# Crossed Molecular beam / Electron beam apparatus (1978–1982)

## Alan Carrington (Southampton, UK)

Source of rotationally-cold molecular ions. Large molecules.

Figure 2. The  $(8, 3)$  band of  $F_2^+ \tilde{A} \ ^2\Pi_u \rightarrow \tilde{X} \ ^2\Pi_g$  at  $4560 \text{ \AA}$ , rotationally resolved. The  $J$  numberings of the two  $P$  branches are shown.

***Daresbury Synchrotron Radiation Source, Cheshire (1988-2008)***

# First simple fluorescence excitation apparatus, Daresbury, 1988–2000

# Resonant and non-resonant excitation

Fluorescence

**Resonant photon excitation**

Formation of a fluorescing fragment via a dissociative Rydberg state of  $AB_n$ . Resonant process.

*e.g.*  $BF_2 / BF_3$   
 $BCl$  and  $BCl_2 / BCl_3$

Fluorescence

**Non-resonant photon excitation**

Sharp turn-on of fluorescence. Signal present for photon energies well in excess of threshold; electron carries away excess energy. Non-resonant process  $\Rightarrow$  formation of excited, fluorescing electronic state of parent ion.

*e.g.*  $N_2^+ / N_2$ ;  $CO_2^+ / CO_2$   
 $BCl_2^+$  and  $BCl_3^+ / BCl_3$

$\text{SiCl}_4$  / tunable vacuum-UV. Detect fluorescence 300–500 nm.  
Emitter is  $\text{SiCl}_4^+ C^2T_2$ , adiabatic IE = 15.1 eV.

*J. Chem. Phys.*, (1988) 89, 2675

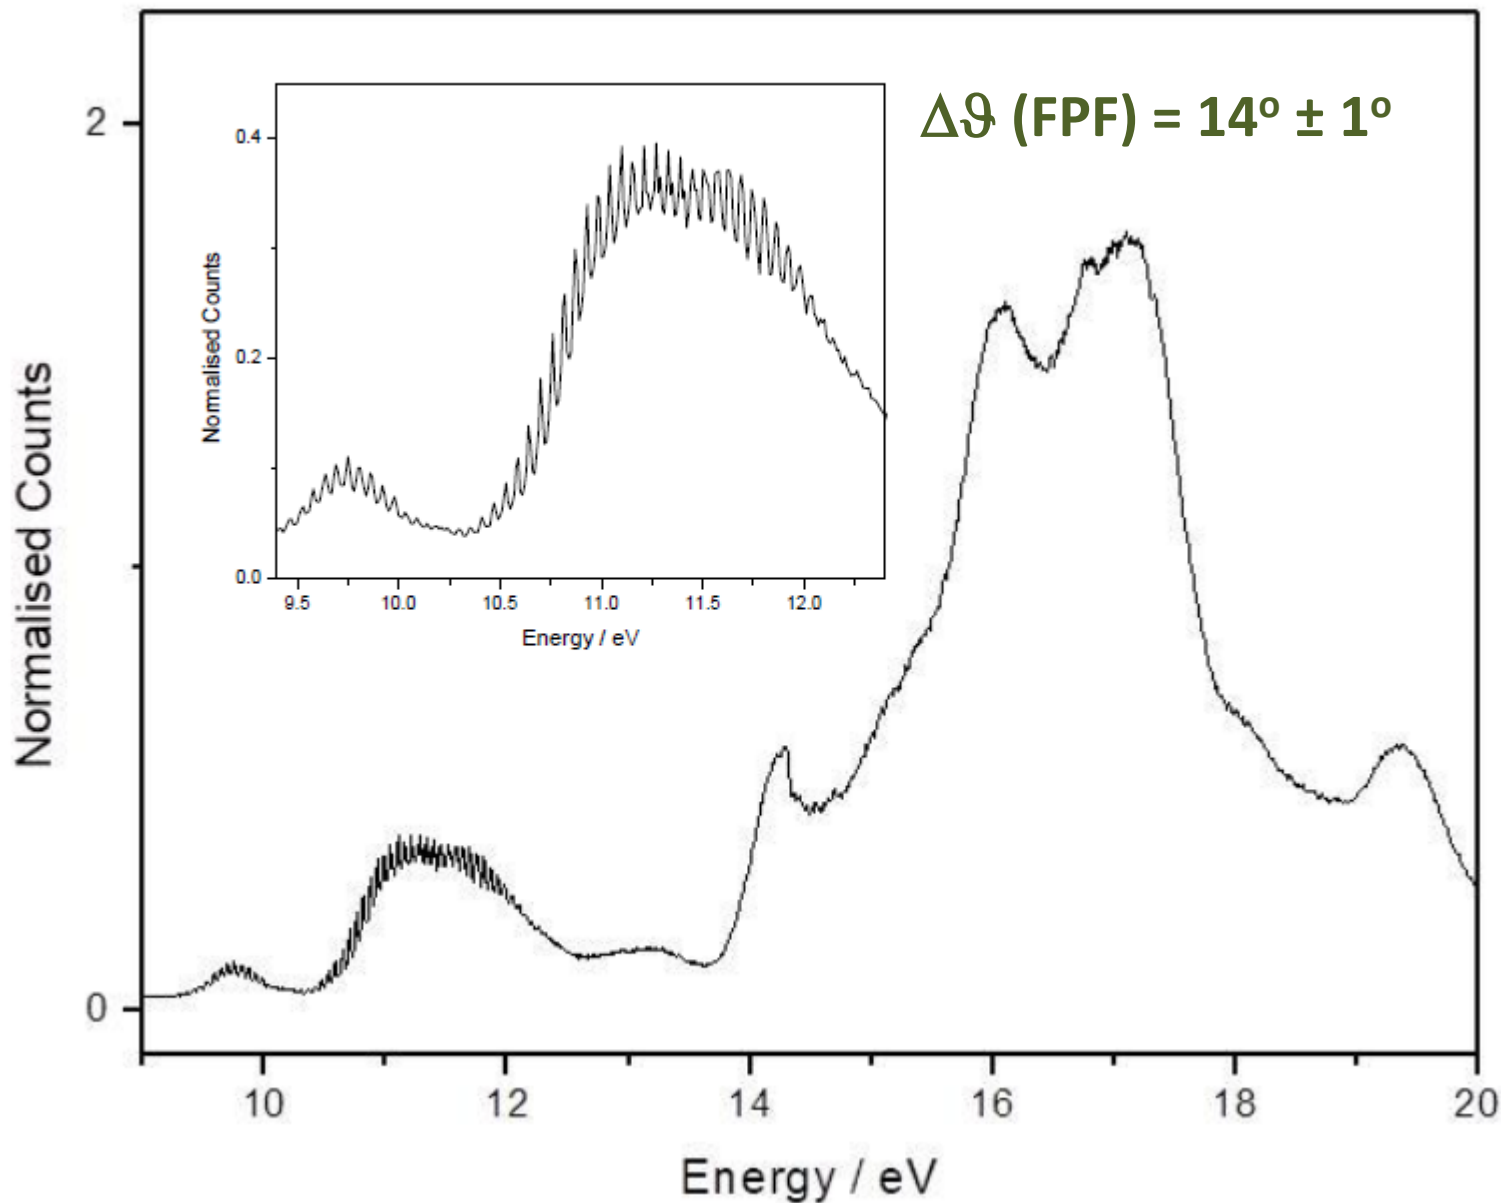

Dispersed fluorescence experiments (1) following vacuum-UV photoexcitation,  
Bessy 1, Berlin, Germany (Baumgärtel and Jochims), 1993–1999

*'Small is beautiful'*

**PF<sub>3</sub> / vacuum-UV excitation. Emission due to PF<sub>2</sub><sup>·</sup> or PF free radicals.**

*Chem Phys. Letts.* (1996) 261, 486 & *J. Chem. Phys.*, (1998) 108, 857

**Low resolution dispersed spectra following PF<sub>3</sub> vacuum-UV photoexcitation, Bessy 1 (1998)**

(a) 9.8 eV PF<sub>2</sub>· A <sup>2</sup>A<sub>1</sub> (<sup>2</sup>Π) – X <sup>2</sup>B<sub>1</sub>

(b) 11.0 eV PF<sub>2</sub>· A <sup>2</sup>A<sub>1</sub> (<sup>2</sup>Π) – X <sup>2</sup>B<sub>1</sub>  
and B <sup>2</sup>B<sub>2</sub> – X <sup>2</sup>B<sub>1</sub>

(c) 14.4 eV PF<sub>2</sub>· C <sup>2</sup>A<sub>1</sub> – X <sup>2</sup>B<sub>1</sub>  
and E <sup>2</sup>B<sub>1</sub> (<sup>2</sup>Π) – A <sup>2</sup>A<sub>1</sub> (<sup>2</sup>Π)

(d) 16.1 eV PF A <sup>3</sup>Π – X <sup>3</sup>Σ<sup>-</sup>

**This still remains the most extensive study of the valence spectroscopy of the PF<sub>2</sub>· free radical**

**Upgrade of the 1 m Seya to a simpler 1 m Wadsworth monochromator on beamline 3.1 at Daresbury, 2001 – 2005 *Nucl. Instr. Meth. Phys. B.*, (2005) 237, 656**

**No entrance slit, used the full horizontal aperture of the beamline.**

**Resolution only depended upon horizontal electron beam size in the ring, c. 0.05 nm.**

Dispersed fluorescence experiments (2) on the new upgraded beamline at Daresbury using CCD multi-channel fluorescence detection, 2004 – 2008.

Record wide range of emitting wavelengths simultaneously; the Jacquinot advantage.

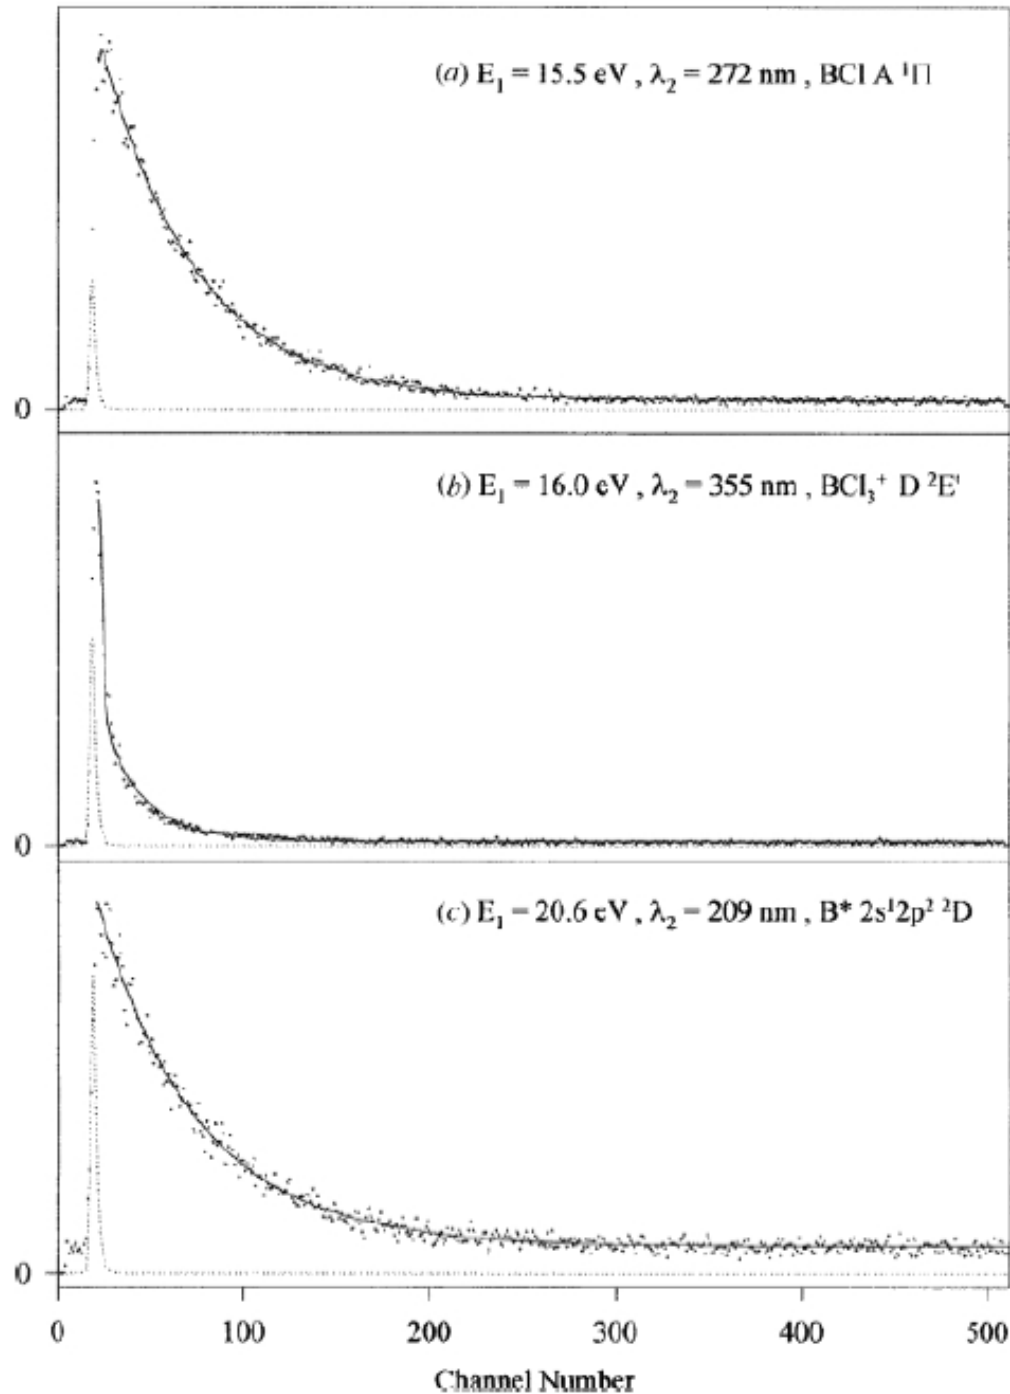

**BF<sub>3</sub> photoexcited at  $h\nu_1 = 14.1$  eV. Emission due to BF<sub>2</sub>· free radical,  $B^2A_1 - X^2A_1$  and  $B^2A_1 - A^2B_1$  valence transitions**

**BCl<sub>3</sub> photoexcited at 17.7 eV. Emission due to BCl<sub>2</sub><sup>+</sup> cation A – X, vibrational progression of 650 ± 30 cm<sup>-1</sup> in either excited or ground state**

**Single-bunch, lifetime experiments  
with  $\text{BCl}_3$  conducted at Bessy 1**

**Both  $E_1$  and  $\lambda_2$  are defined**

(a)  $E_1 = 15.5 \text{ eV}$ ,  $\lambda_2 = 272 \text{ nm}$

$\text{BCl } A \ ^1\Pi$ ,  $\tau = 20.0 (2) \text{ ns}$

(b)  $E_1 = 16.0 \text{ eV}$ ,  $\lambda_2 = 355 \text{ nm}$

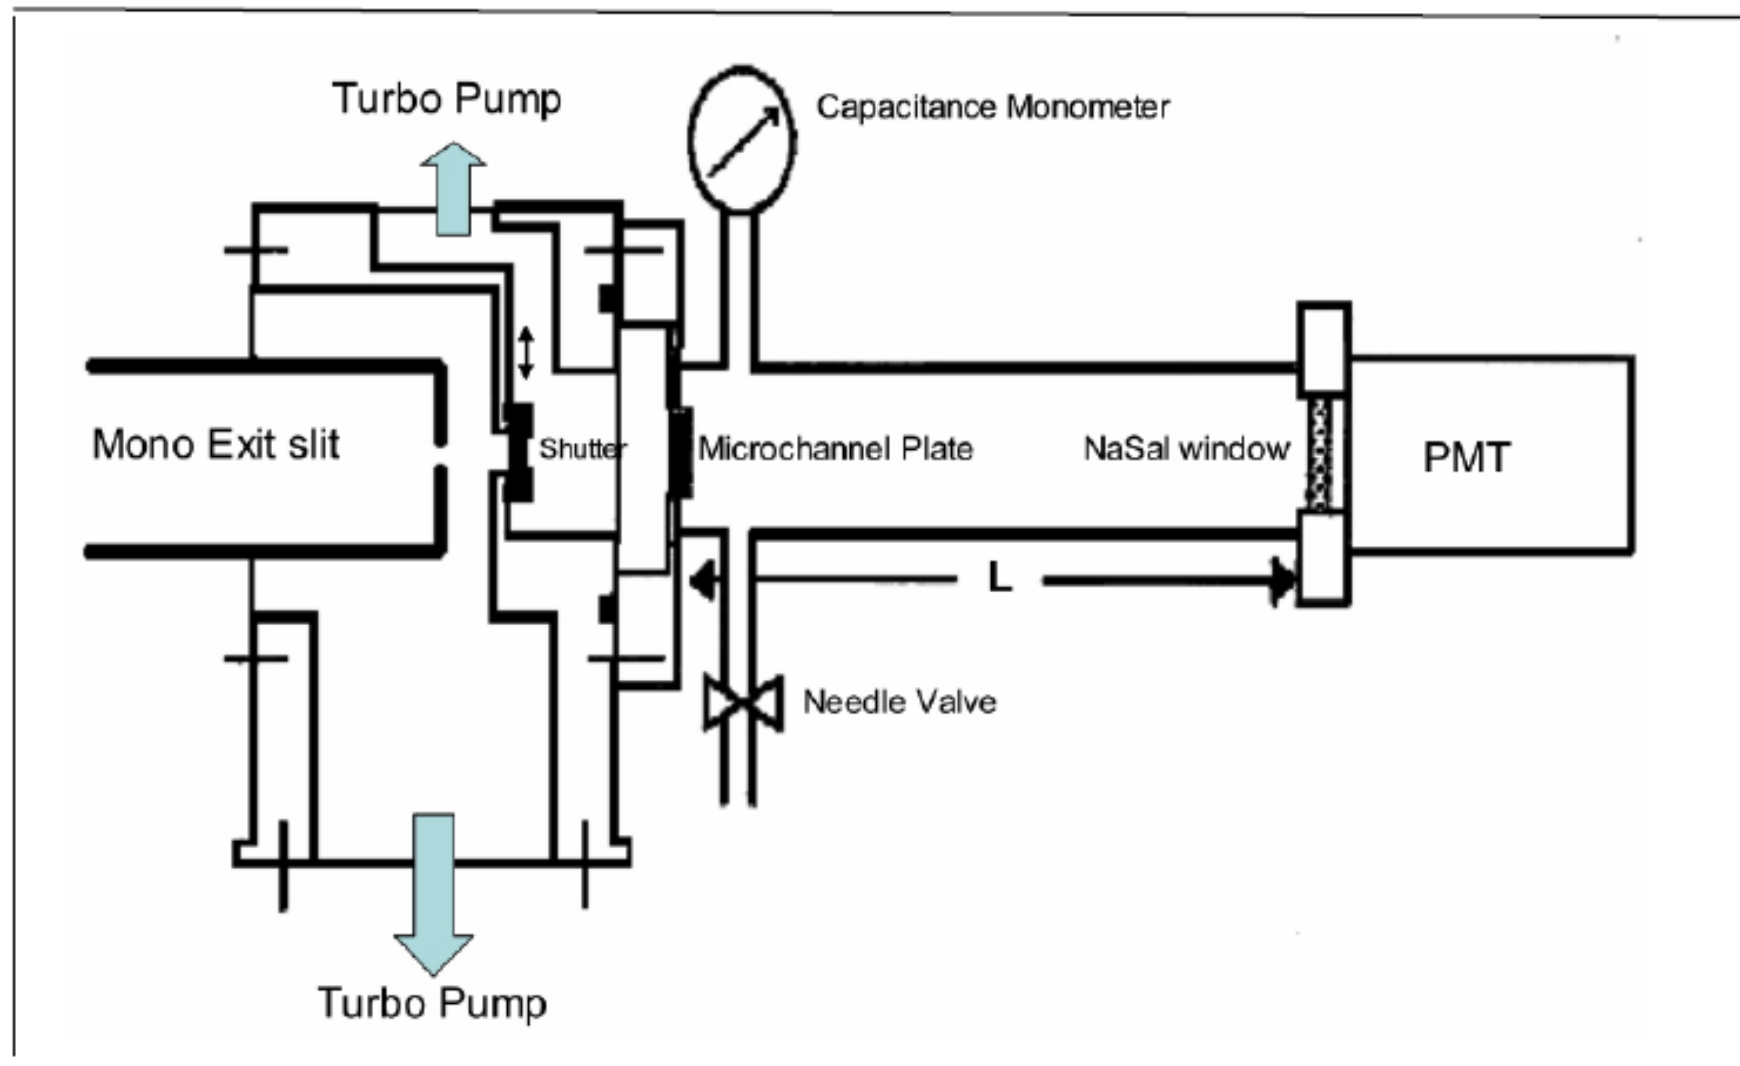

$\text{BCl}_3^+ D \ ^2E'$ ,  $\tau = 8.9 (2) \text{ ns}$

(c)  $E_1 = 20.6 \text{ eV}$ ,  $\lambda_2 = 209 \text{ nm}$

$\text{B}^* (2s^1 2p^2) \ ^2D$ ,  $\tau = 21.5 (6) \text{ ns}$

***J. Phys. B.*, (1999) 32, 2569**

Absorption experiments, Bessy 1, for  $\lambda < 105$  nm, but Beer-Lambert still applies: absolute values of vacuum-UV absorption cross sections are determined

**Vacuum-UV absorption spectrum of SF<sub>5</sub>CF<sub>3</sub> ; important to determine the lifetime of this greenhouse gas in the earth's atmosphere ( $\tau = 800\text{--}1000$  years)**

*Chem. Phys. Letts.*, (2003) 367, 697

# Multi-purpose coincidence apparatus, Daresbury UK, 1993–2008

One of the early 'position-sensitive' detectors to study photofragmentation processes in polyatomic molecular ions (TPEPICO spectroscopy)

Later, was adapted to study:

**Photon Fluorescence Coincidence (PIFCO) spectroscopy**

**Threshold PhotoElectron Fluorescence Coincidence (TPEFCO) spectroscopy**

*Meas. Sci. Tech.*, (1992) **3**, 891

## PIFCO spectra from $\text{SiCl}_4^+$

Fluorescence from  $C^2T_2$  state of  $\text{SiCl}_4^+$  photoexcited at 15.1 eV

Unfiltered fluorescence : Coincidences observed between Photons and two Ions whose time-of-flight correspond to  $\text{SiCl}_3^+$  and  $\text{SiCl}_4^+$

UV fluorescence: Emission to the  $X^2T_1$  ground state of the cation. This state is bound. Coincidences are detected between Photons and the parent ion only

Visible fluorescence : Emission to the  $A^2T_2$  state of  $\text{SiCl}_4^+$ . This state is repulsive and one Si-Cl bond breaks. Coincidences are now detected between Photons and the daughter ion,  $\text{SiCl}_3^+$

*J. Chem. Phys.*, (1994) 101, 10559

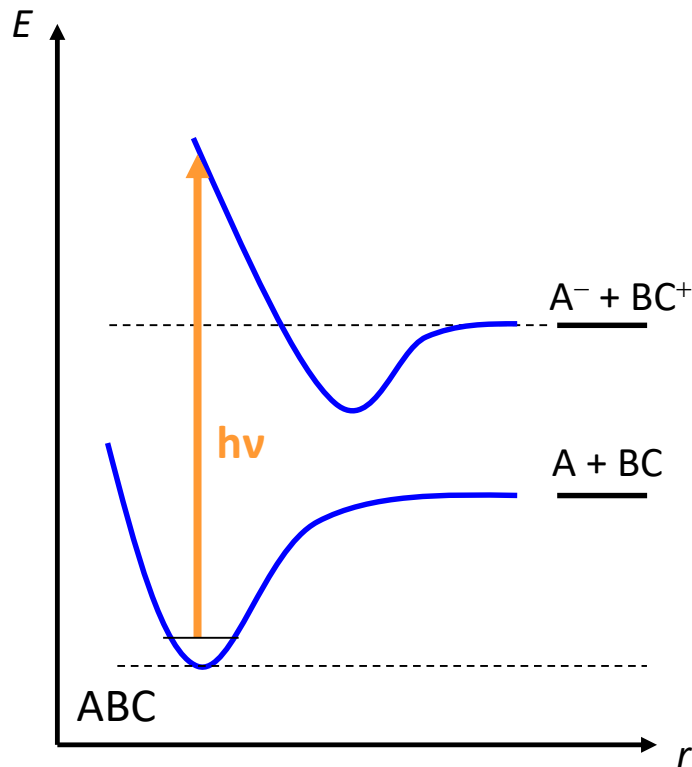

# Vacuum-UV negative photoion spectroscopy:

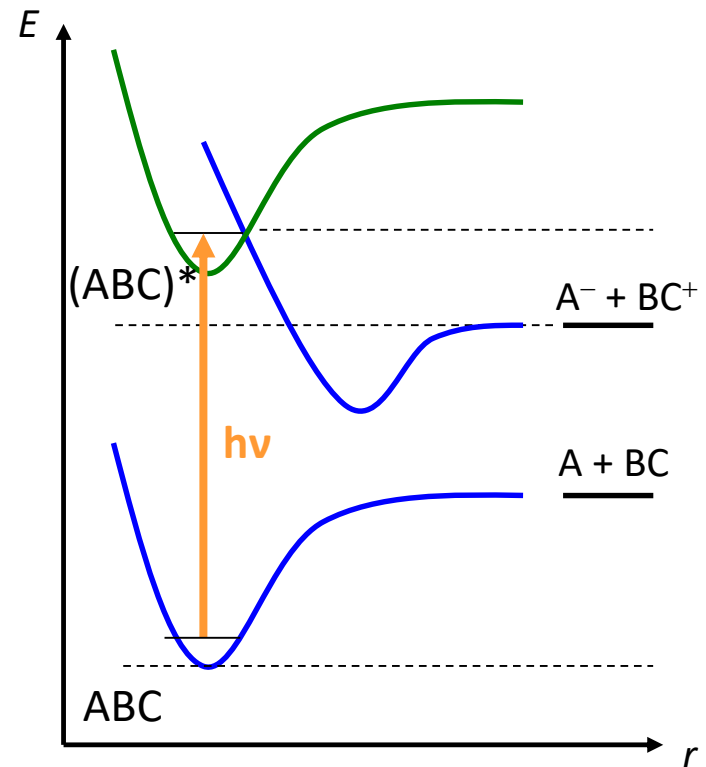

(Daresbury UK, 2006-2011)

Direct ion-pair formation

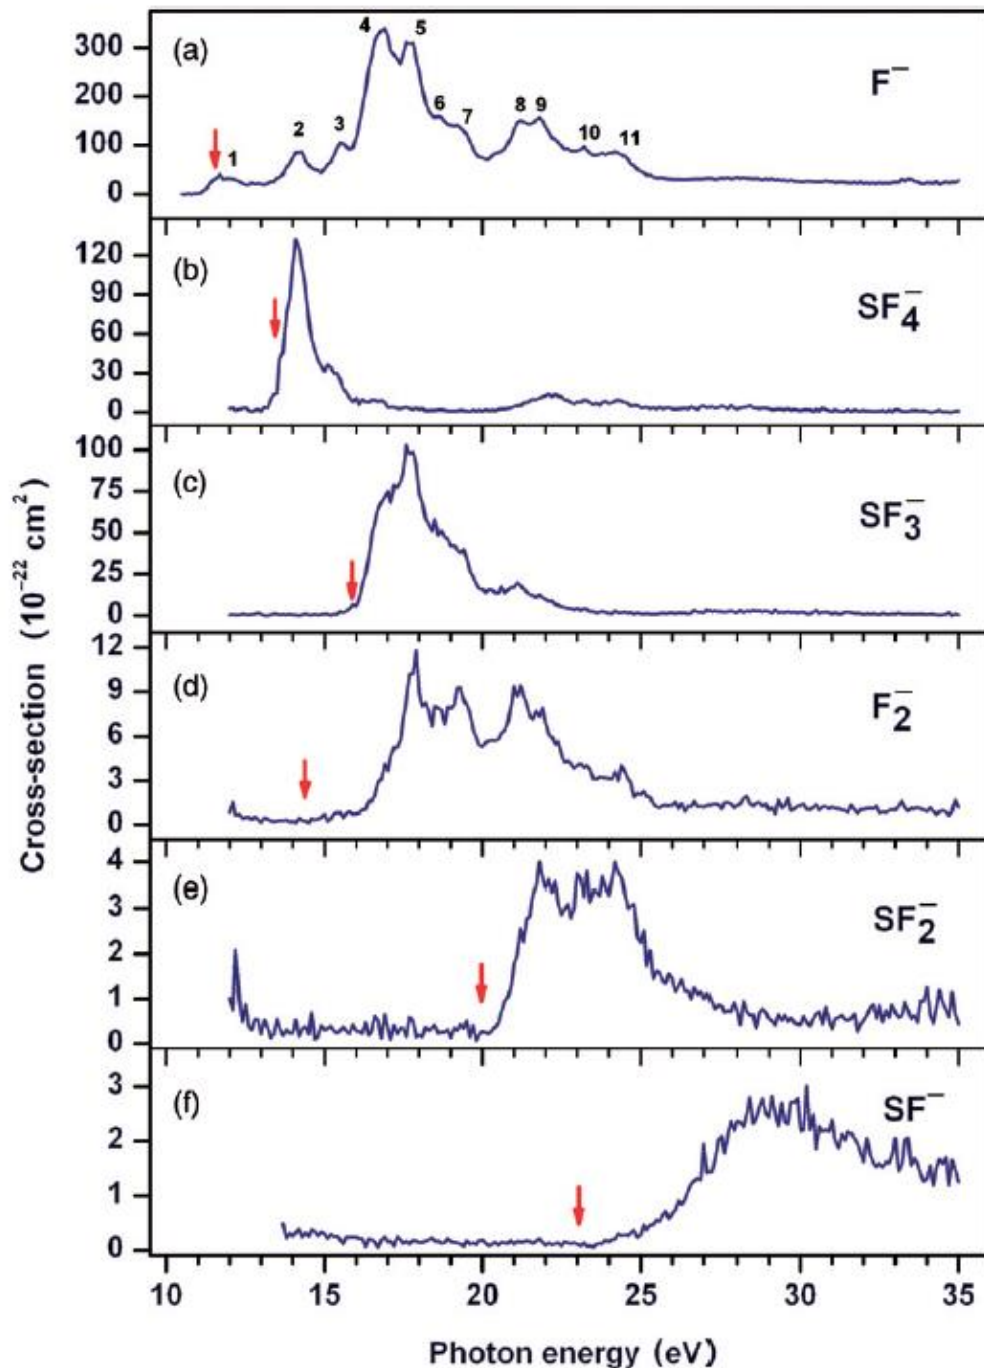

Predissociation into ion pairs

# Apparatus to detect negative photoions (or anions) as a function of photon energy : collaboration with Latimer (Queens University, Belfast)

## Anion production from $SF_5CF_3$

Large number of anions are observed.  $F^-$  is the strongest, followed by  $SF_4^-$  and  $SF_3^-$ .  $F_2^-$ ,  $SF_2^-$  and  $SF^-$  anions are the weakest.

By calibration initially with  $CF_4$  and  $SF_6$ , *absolute* values of cross sections and quantum yields could be determined.

*J. Chem. Phys.*, (2008) 128,  
124315

Table 2. Appearance energies, cross-sections and quantum yields for anions observed from photoexcitation of SF<sub>6</sub>, CF<sub>4</sub>, and SF<sub>5</sub>CF<sub>3</sub>.

Molecule [AIE <sup>a</sup> (eV)]	Anion	AE <sup>b</sup> (eV)	Cross-section <sup>c</sup> (cm <sup>2</sup> )	Energy <sup>d</sup> (eV)	Quantum yield <sup>e</sup>
